Bemerkungen zur Einrichtung und Verwendung des Katalogs.

Die ersten drei Spalten des Katalogs enthalten Nummer, Rektaszension und Deklination jedes Sterns in Übereinstimmung mit dem Potsdamer Katalog (Publikationen des Astrophysikalischen Observatoriums zu Potsdam, Bd. 9). Die Hunderter der Nummer und die Rektaszensionsstunde sind am Kopfe jeder Seite angemerkt. Ein * an der Nummer verweist auf die Anmerkungen am Fusse der Seite. Dann folgen die aus den 3 einzelnen Expositionen jeder Platte mit Hülfe der definitiven Schwärzungskurven abgeleiteten Sterngrößen. Die Nummern der Platten sind am Kopfe der betreffenden Spalte angegeben. Größenbestimmungen vom Gewicht $\frac{1}{2}$ sind durch runde Klammern, solche vom Gewicht $\frac{1}{4}$ durch eckige Klammern eingeschlossen. Freigelassene Stellen bedeuten, daß die Schwärzung des Bildes zur Messung zu groß oder zu gering war. (In letzterem Fall ist Unsichtbarkeit des Bildes einbegriffen). Wo ein Zweifel walten kann, welcher von beiden Gründen vorliegt, ist die wirkliche Sachlage angemerkt.

Die Spalte *M* giebt das Endresultat aus sämtlichen Platten für jeden Stern. (Ist der Stern auf allen Platten zu hell oder zu schwach zur Messung gewesen, so ist darauf in der Spalte *M* durch ein * resp. ein — hingewiesen. Der häufige Fall, daß sich zwei Nachbarsterne überdecken und nur die Summe ihrer Intensitäten der Messung zugänglich war, ist durch ein \times bei dem in α folgenden der beiden Sterne gekennzeichnet.) Addiert man die an letzter Stelle stehenden „Reste“ zu *M*, so erhält man die Resultate der einzelnen Platten, und zwar in derselben Reihenfolge, in der die Platten vorher angeordnet sind. Kleine unterstrichene Zahlen bedeuten negative Reste, sind also von *M* zu subtrahieren.

Über die Verwendung des Katalogs sind folgende Bemerkungen zu machen:

a) In vielen Fällen wird es genügen, für einen Stern die Größe *M* zu entnehmen, welche die Meridianhelligkeit für Göttingen bedeutet. Wünscht man vom Ort unabhängige Zenithelligkeiten zu erhalten, so hat man von *M* die in Tabelle II als Funktion der Deklination tabulierte photographische Extinktion abzuziehen¹⁾.

b) Wünscht man die Ableitung des Plattenresultates aus den Einzelmessungen zu kontrollieren, so vereinigt man die (1 bis 3) Einzelmessungen jeder Platte

1) Es ist hier wieder die 2.5 fache Potsdamer visuelle Extinktion angesetzt.

nach ihrem Gewicht zu einem Mittel. Einzelwerte vom Gewicht $\frac{1}{4}$ werden dabei weggelassen, wenn das Gewicht der übrigen vorhandenen Messungen den Wert 1 erreicht. An das Mittel ist dann die von Rektaszension α und Deklination δ abhängige Korrektur anzubringen, welche man erhält, indem man mit $\alpha - \alpha_0$ (α_0 Rektaszension der Plattenmitte) und δ linear zwischen den in Tabelle V gegebenen Endwerten der Korrekturen interpoliert.

Im Falle quadratischer Korrektur erhält man aus den 3 Zahlen der Tabelle, die mit y_1, y_2, y_3 bezeichnet werden mögen, die zu verwendende Korrektur y nach den Formeln:

$$\alpha\text{-Korrektur: } y = y_2 + (y_3 - y_1) \frac{\alpha - \alpha_0}{60^m} + 2(y_1 + y_3 - 2y_2) \left(\frac{\alpha - \alpha_0}{60^m} \right)^2$$

$$\delta\text{-Korrektur: } y = y_2 + (y_3 - y_1) \frac{\delta - 10^0}{20^0} + 2(y_1 + y_3 - 2y_2) \left(\frac{\delta - 10^0}{20^0} \right)^2.$$

Außer diesen Korrekturen ist noch die aus Tabelle IV mit den Argumenten $\alpha - \alpha_0$ und δ zu entnehmende Gesichtsfeldkorrektur hinzuzufügen¹⁾.

Z. B. erhält man für Stern No. 47 auf Platte 354 als Mittel aus den 3 Expositionen

$$\frac{7,29 + 7,30 + 7,31}{3} = 7,30,$$

$$\text{dazu nach Tabelle V } \alpha\text{-Korrektur: } 5 \frac{(0^h 25^m - 0^h 30^m)}{30^m} = -1$$

$$\delta\text{-Korrektur: } -5 \frac{4^0.3 - 10^0}{10^0} = +3$$

$$\text{Gesichtsfeldkorrektur nach Tabelle IV} = -3$$

$$\text{Resultat aus Platte 354} = 7,29.$$

Der Katalog giebt $M = 7,25$ und als Rest der Platte 354 gegen diesen Wert +5. Das giebt zusammen 7,30 in genügender Übereinstimmung mit dem eben gefundenen Ergebnis.

c) Wünscht man etwa einen Stern auf Veränderlichkeit zu untersuchen, so findet man die Daten der Exposition jeder im Katalog bearbeiteten Platte in Tabelle I.

Es kann hier auch nützlich sein, um möglichst von kleinen restierenden systematischen Unterschieden der Aufnahmen frei zu werden, die Messungen des verdächtigen Sterns für jede Aufnahme rein differentiell durch Anschluß an Nachbarsterne zu reduzieren. Die Nachbarsterne sollen dabei nach Lage wie nach Helligkeit den zu untersuchenden Stern möglichst symmetrisch umschließen.

1) Das Nomogramm ergibt sich aus den Formeln:

$$\text{Gesichtsfeldkorrektur} = 2240 \cdot \text{tg}^2 \angle,$$

$$\cos \angle = \sin \delta \sin 10^0 + \cos \delta \cos 10^0 \cos (\alpha - \alpha_0),$$

wenn man $\cos (\alpha - \alpha_0)$ als Abszisse und $\cos \angle$ als Ordinate benutzt.

Für den verdächtigen Stern No. 43 sind z. B. geeignete Vergleichsterne die Sterne No. 39, 42, 45, 48. Diese Sterne geben bei der ersten Aufnahme auf Platte 161 die Abweichungen gegen die M -Werte

$$+0^m.09 \quad +0.10 \quad +0.07 \quad -0.05 \quad \text{Mittel: } +0^m.05.$$

Stern 43 gibt die Abweichung von seinem M -Werte (= $7^m.17$): -0.18 . Die an diese Nachbarsterne angeschlossene relative Helligkeit von Stern No. 43 wird daher für die erste Exposition auf Platte 161: $7.17 - 0.23 = 6.94$. Die auf solche Weise gewonnenen Helligkeiten sind in den Hundertsteln der Größenklasse zuverlässiger, als die mit den allgemeinen Reduktionskonstanten der Platte abgeleiteten.

d) Will man den photographischen Prozeß untersuchen, so kann man von den Größen des Katalogs zurückgehen zu den gemessenen Schwärzungen mittelst der in Tabelle V wiedergegebenen Schwärzungskurven der Platten. Zu den Größen der II. und III. Aufnahme jeder Platte hat man die in der Tabelle gegebene Differenz I—II resp. I—III zu addieren, bevor man mittelst der Daten der Schwärzungskurve von Größe zu Schwärzung übergeht.

Will man schließlich noch untersuchen, wieviel an den Rektaszensions- und Deklinationsgängen der Platten auf diese selbst kommt, so hat man von den in Tabelle V enthaltenen Gängen die Extinktionsgänge abzuziehen. Letztere erhält man aus Tabelle III mit Hilfe des in Tabelle I angegebenen Stundenwinkels der Aufnahmen.

Hülftafeln.

Tafel I. Verzeichnis der Platten.

No.	Tag	t	Aufn.	Mess.	Bemerkungen
37	1904 Juli 15.	-13 ^m	M.	W. Schf.	Klar, aber nicht sehr durchsichtig.
	1905				
61	Jan. 16.	+15	M.	W. Schf.	Himmel, etwas dunstig, besonders zum Horizont hin.
80	Mai 3.	-18	M.	Schf. Kr.	
96	Mai 28.	+10	Sch.	W. Schf.	Schwacher gleichförmiger Dunst.
98	Mai 29.	+30	Sch.	Schf. W.	Sehr klar.
100	Mai 30.	+74	Sch.	W. Schf.	Sehr klar.
140	Aug. 21.	+20	M.	W. W.	Klar.
143	„ 22.	-38	M.	Schf. J.	Klar.
161	Dez. 17.	+29	M.	J. W.	Wolkenfrei. Am Horizont etwas dunstig.
163	„ 17.	+13	M.	J. W.	Wolkenfrei. Horizont recht dunstig.
164	„ 18.	+35	M.	J. W.	Klar.
	1906				
171	Jan. 1.	- 5	M.	J. W.	Klar. Mond.
177	„ 15.	+45	M.	J. W.	Klar.
178	„ 15.	+39	M.	J. W.	Klar.
181	„ 16.	- 7	M.	J. W.	Klar.
219	Mai 16.	+26	K.	Schf. J.	Klar.
223	„ 23.	+ 1	K.	W. Schf.	Sehr klar.
281	Juli 23.	+ 3	K.	Schf. W.	Ziemlich dunstig.
290	„ 28.	+ 2	K.	W. J.	Sehr klar, zuletzt Morgendämmerung.
291	„ 29.	+11	K.	Schf. W.	Erst etwas dunstig, zuletzt sehr klar. Nicht sehr gut pointiert.
314	Aug. 22.	-85	K.	W. J.	Dunstig.
315	„ 22.	-92	K.	J. W.	Dunstig.
317	„ 23.	-87	K.	Schf. W.	Klar.

1908					
621	Jan. 24.	-25 ^m	K.	W. J.	Ziemlich dunstig, ruhig.
622	„ 24.	-30	K.	W. Schf.	Ziemlich dunstig, ruhig. 15 ^m vor Schluß der Aufnahme geht der Mond auf.
628	Febr. 3.	-25	K.	W. J.	Ziemlich klar, ruhig.
631	März 25.	-33	K.	Schf. W.	Anfangs ziemlich dunstig, aber anscheinend gleichmäßig, zuletzt wird es klar.
638	Mai 19.	+23	K.	Schf. Kr.	Anfangs ziemlich klar, bei Schluß der Aufnahme geht der Mond auf und es werden am Horizont Wolken sichtbar.
640	„ 29.	+40	K.	Schf. Kr.	Sehr unsicheres Wetter.
641	„ 30.	+ 8	K.	Schf. W.	Ziemlich klar.
642	„ 30.	-14	K.	W. Schf.	Sehr klar.
650	Juni 24.	+33	K.	W. Schf.	Sehr klar.
652	„ 28.	+68	K.	Schf. W.	Anfangs etwas dunstig, später klar. Am Nordhorizont eine Wolkenbank.
653	Juli 2.	+18	K.	Schf. W.	Anfangs etwas Dunst, später sehr klar.
654	„ 2.	-20	K.	Schf. Schf.	Sehr klar, zuletzt erhebliche Morgendämmerung.
656	„ 22.	-25	K.	Schf. W.	Sehr klar.
657	„ 22.	-54	K.	Schf. Kr.	Sehr klar. Kurz nach Schluß der Aufnahme Mondaufgang.
672	Sept. 30.	+71	Dz.	Schf. W.	Klar. Etwas Bodennebel.

Die Abkürzungen in der Spalte „Aufnahme“ bedeuten: B. = Beljawsky, Dz. = Dziewulski, K. = Kohlschütter, M. = Meyermann, Sch. = Schwarzschild.

Die Abkürzungen in der Spalte „Messungen“ bedeuten: J. = Jastram, Kr. = Kreibohm, Schf. = Schwaff, W. = Wiele.

Tafel II. Meridianextinktion für Göttingen.

Deklination:	0°	2°	4°	6°	8°	
Extinktion:	0 ^m .33	0.29	0.26	0.22	0.19	
Deklination:	10°	12°	14°	16°	18°	20°
Extinktion:	0.17	0.15	0.13	0.11	0.09	0.08

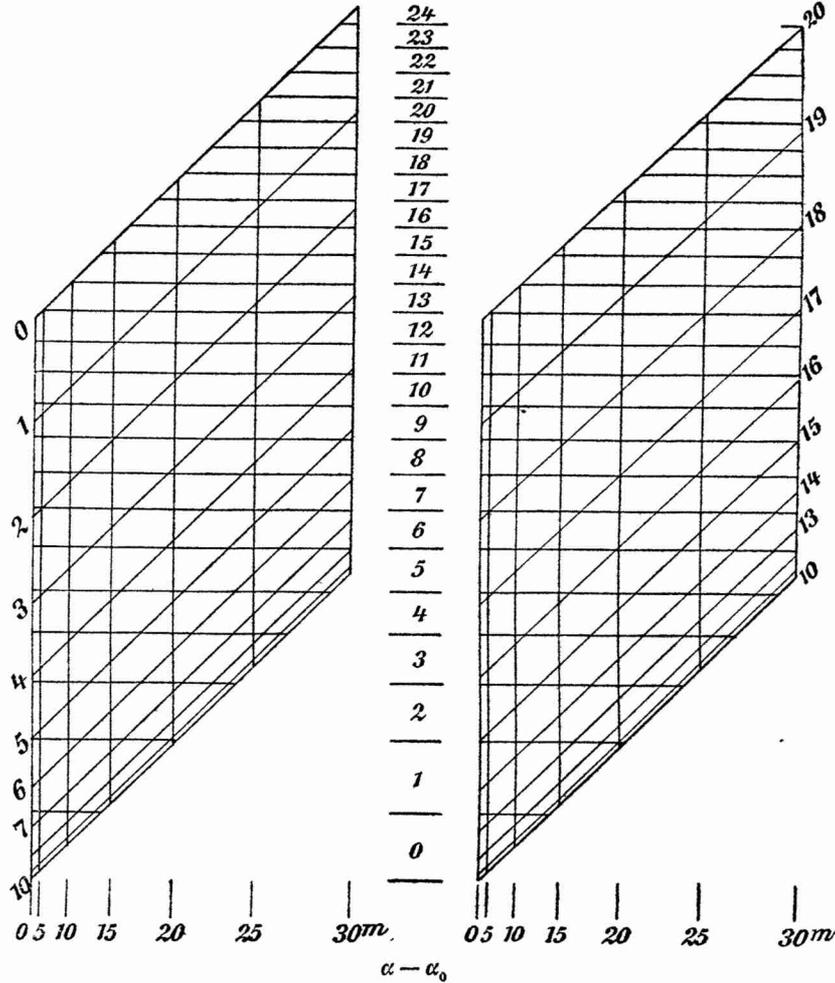

Tafel III. Differentielle Extinktion.

$\pm t$	0 ^m	15 ^m	30 ^m	45 ^m	60 ^m	75 ^m	90 ^m
δ -Gang	0	+1	+2	+2	+3	+4	+5
α -Gang	0	1	2	4	6	7	8

Der α -Gang hat das Vorzeichen des Stundenwinkels t , die Reduktion für Extinktion auf die Mitte der Platte ($\alpha = \alpha_0$, $\delta = 10^\circ$) hat den Betrag:

$$\delta\text{-Gang} \cdot \left(\frac{\delta - 10^\circ}{20^\circ} \right) + \alpha\text{-Gang} \cdot \left(\frac{\alpha - \alpha_0}{60^m} \right).$$

Tafel IV. Nomogramm der Gesichtsfeldkorrektur.

Horizontales Argument ist $|\alpha - \alpha_0|$ in Zeitminuten (Skala am unteren Rand von 0 bis 30 laufend, getrennt für linkes und rechtes Diagramm).

Vertikales Argument ist die Gesichtsfeldkorrektur k_0 in Hundertstel Größenklassen (Skala auf der mittleren vertikalen Längsaxe von 0 bis 24 ansteigend, gemeinsam für linkes und rechtes Diagramm).

Die schrägen Transversalen sind die Linien konstanter Deklination (Parallelkreise an der Sphäre) und sind mit der Deklination selbst beziffert. Das linke Diagramm umfaßt die Zone von 0° bis +10°, das rechte von +10° bis +20° Deklination. Man interpoliert zwischen ihnen linear, und zwar nicht in Richtung des kürzesten Abstands, sondern entlang der zu $|\alpha - \alpha_0|$ gehörigen Parallelen zur vertikalen Axe.

Tafel V. Reduktionskonstanten.

42 AKTINOMETRIE DER STERNE DER B. D. BIS ZUR GRÖSSE 7,5, ZONE 0° BIS 20°.

ϵ_0	Plattennummer	A. R.-Korrektur für $\alpha - \epsilon_0$		δ -Korrektur für $\delta = 20^\circ$	Differenz		Schwärzungen der längsten Aufnahme zu den Sterngrößen:															Gewichtsgrenzen $\frac{1}{3}$ $\frac{1}{4}$

1041) Schwer zu messen, weil teilweise überdeckt von Comes 7^m.7 B. D. + 1°1663 8^m.8. Nach einer visuellen Messung der Herren Müller und Kron vom 15. Febr. 1910 ist der Comes um 1^m.20 schwächer als der Hauptstern, also gleich 8^m.04, mithin auffällig schwach im Vergleich zur photographischen Helligkeit.

1819) Comae 8^m.9 B. D. + 4° 28'15" 8^m.2.

1821) Messung auf Platte 219 (kleinen Formates) wegen Randnähe bedenklich.

Notiz zu Platte 460. Die Platte ist bei ungünstiger Luft aufgenommen und sehr schwach entwickelt. Besonders die schwachen Sterne unzuverlässig.

Notiz zu Platte 80. Platte kleinen Formates. Starke systematische Fehler bei randnahen schwachen Sternen.

2817) Neumessung auf Platte 536 gibt 8.79. Damit Mittel: 8.74, Rest: 4 11 $\frac{6}{6}$ 10.

2840) Comes 8^m.0 B. D. + 10° 4036 8^m.0.

2845) Vergleich mit Stern 2879 zeigt, daß es sich um systematische Abweichungen bei den hellsten Sternen, nicht um Veränderlichkeit handelt.

2872), 2873) Summe beider Sterne gemessen. Aus überstehenden Randstreifen läßt sich erkennen, daß beide Sterne nahe gleich hell und jeder einzelne daher von der Größe 7.73 ist.

2879) Vgl. Stern 2845.

2880) Kontrollmessung auf Platte 536 gibt 8.38. Damit Mittel 8.29, Reste: 1 5 15 10.

2882) Variabler S Sagittae.

2894) Infolge teilweiser Überdeckung mit 2893 nur schwer zu messen. Comes 9^m.2 B. D.

+ 17° 4187 8^m.7.
