A NOTE ON REFLECTIVE SUBCATEGORIES  
DEFINED BY PARTIAL ALGEBRAS  
Jenő SZIGETI

**Abstract:** By using a generalized partial  $F$ -algebra a full subcategory of a certain comma category will be defined. Then a sufficient condition will be given to provide the reflectivity of this subcategory.

**Key words:**  $F$ -algebra, generalised partial  $F$ -algebra, comma category, free completion of a g.p.a.

Classification: 18A25, 18A40, 18B20

---

1. Preliminaries. Given an endofunctor  $F: \underline{A} \rightarrow \underline{A}$  on the category  $\underline{A}$  one can define the category  $\underline{A}(F)$  of  $F$ -algebras (see e.g. in [1 - 5]). Let  $U: \underline{A}(F) \rightarrow \underline{A}$  denote the canonical forgetful functor.

A generalized partial  $F$ -algebra (a g.p.a.) in the sense of Koubek and Reiterman is a diagram  $Fa \xleftarrow{P} x \xrightarrow{q} a$  in  $\underline{A}$  (cf. [5]).

In the present paper we shall consider the full subcategory  $(a \downarrow U)^{\langle P, q \rangle}$  of the comma category  $(a \downarrow U)$  which can be defined in a natural way by means of a g.p.a. Thus the free completion problem for the g.p.a.  $Fa \xleftarrow{P} x \xrightarrow{q} a$  (see [3, 5]) will be equivalent to the existence of an initial object in  $(a \downarrow U)^{\langle P, q \rangle}$ .

The main aim of this note is to establish conditions providing the reflectivity of  $(a \downarrow U)^{\langle P, q \rangle}$  in  $(a \downarrow U)$ . Since the reflection functor sends  $(a \downarrow U)$ -initial objects to  $(a \downarrow U)^{\langle P, q \rangle}$ -initial ones we shall also obtain criteria for the existence of the free

completion.

2. Reflective subcategories in  $(a \downarrow U)$ . Given a g.p.a.  $Fa \xleftarrow{p} x \xrightarrow{q} a$  define the objects of the full subcategory  $(a \downarrow U)^{\langle p, q \rangle}$  in  $(a \downarrow U)$  by requiring the commutativity of (2./1).

$$(2./1) \quad \begin{array}{ccc} Fa & \xleftarrow{p} x \xrightarrow{q} & a \\ \downarrow Ff & & \downarrow f \\ Fb & \xleftarrow{u} & b \end{array}$$

In other words:  $\langle \langle b, u \rangle, f \rangle \in |(a \downarrow U)^{\langle p, q \rangle}|$  iff (2./1) commutes. Now we are ready to formulate our main result.

2.1. Theorem. Let  $\langle \langle b, u \rangle, f \rangle \in |(a \downarrow U)|$  be an object and suppose that  $\underline{A}(F)$  has coequalizers of all pairs. If there are initial objects in the comma categories  $(x \downarrow U)$  and  $(b \downarrow U)$  then there exists an initial object in  $(\langle \langle b, u \rangle, f \rangle \downarrow E)$ , where  $E$  is the natural  $(a \downarrow U)^{\langle p, q \rangle} \rightarrow (a \downarrow U)$  embedding.

Proof. Let  $x \xrightarrow{\bar{e}} \bar{b} \xleftarrow{\bar{u}} F\bar{b}$  and  $b \xrightarrow{\bar{e}} \bar{b} \xleftarrow{\bar{u}} F\bar{b}$  represent initial objects in  $(x \downarrow U)$  and  $(b \downarrow U)$  respectively. Clearly, there exist unique  $\underline{A}(F)$ -morphisms  $p^0, q^0: \langle \bar{b}, \bar{u} \rangle \rightarrow \langle \bar{b}, \bar{u} \rangle$  and  $r: \langle \bar{b}, \bar{u} \rangle \rightarrow \langle b, u \rangle$  making the diagrams (2./2-4) commute.

$$(2./2) \quad \begin{array}{ccccccc} x & \xrightarrow{p} & Fa & \xrightarrow{Ff} & Fb & \xrightarrow{u} & b \\ \downarrow \bar{e} & & & & & & \downarrow \bar{e} \\ U \langle \bar{b}, \bar{u} \rangle & \xrightarrow{U p^0} & & & & & U \langle \bar{b}, \bar{u} \rangle \end{array}$$

$$(2./3) \quad \begin{array}{ccc} & a & b \\ \bar{g} \downarrow & \xrightarrow{q} & \xrightarrow{f} \\ & a & b \\ U \langle \bar{b}, \bar{u} \rangle & \xrightarrow{Uq^0} & U \langle \bar{b}, \bar{u} \rangle \end{array} \quad \bar{g}$$

$$(2./4) \quad \begin{array}{ccc} & b & \\ \bar{g} \swarrow & & \searrow l_b \\ U \langle \bar{b}, \bar{u} \rangle & \xrightarrow{Ux} & U \langle b, u \rangle \end{array}$$

Form the coequalizer  $\langle \bar{b}, \bar{u} \rangle \xrightarrow[\text{roq}^0]{\text{rop}^0} \langle b, u \rangle \xrightarrow{e^0} \langle b^0, u^0 \rangle$  in  $\underline{A}(\mathcal{F})$ .

We claim that  $e^0: \langle \langle b, u \rangle, f \rangle \rightarrow E \langle \langle b^0, u^0 \rangle, e^0 \circ f \rangle$  is initial in  $(\langle \langle b, u \rangle, f \rangle \downarrow E)$ .  $u^0 \circ (Fe^0) \circ (Ff) \circ p = e^0 \circ u \circ (Ff) \circ p =$   
 $= e^0 \circ \text{ro} \bar{g} \circ u \circ (Ff) \circ p = e^0 \circ \text{rop}^0 \circ \bar{g} = e^0 \circ \text{oro} q^0 \circ \bar{g} = e^0 \circ \text{oro} \bar{g} \circ \text{of} \circ q =$   
 $= e^0 \circ \text{of} \circ q$  proves that  $\langle \langle b^0, u^0 \rangle, e^0 \circ f \rangle \in |(\mathcal{A} \downarrow U) \langle P, Q \rangle|$  as required.

For a morphism  $e': \langle \langle b, u \rangle, f \rangle \rightarrow E \langle \langle b', u' \rangle, f' \rangle$  in  $(\mathcal{A} \downarrow U)$  we have  
 $(U(e' \circ \text{rop}^0)) \circ \bar{g} = e' \circ \text{rop}^0 \circ \bar{g} = e' \circ \text{oro} \bar{g} \circ u \circ (Ff) \circ p = e' \circ u \circ (Ff) \circ p =$   
 $= u' \circ (Fe') \circ (Ff) \circ p = u' \circ (Ff') \circ p = f' \circ q = e' \circ \text{of} \circ q = e' \circ \text{oro} \bar{g} \circ \text{of} \circ q =$   
 $= e' \circ \text{oro} q^0 \circ \bar{g} = (U(e' \circ \text{oro} q^0)) \circ \bar{g}.$

The  $(\mathcal{A} \downarrow U)$  initiality of  $\langle \langle \bar{b}, \bar{u} \rangle, \bar{g} \rangle$  immediately gives that  $e' \circ \text{rop}^0 = e' \circ \text{oro} q^0$ . Hence there is a unique  $\underline{A}(\mathcal{F})$ -morphism  $t: \langle b^0, u^0 \rangle \rightarrow \langle b', u' \rangle$  with  $t \circ e^0 = e'$ . But easily can be seen that for a morphism  $t: \langle b^0, u^0 \rangle \rightarrow \langle b', u' \rangle$  the condition  $t \circ e^0 = e'$  is equivalent to the commutativity of (2./5). ||

$$(2./5) \quad \langle\langle b, u \rangle, f \rangle \begin{array}{l} \xrightarrow{e^0} E\langle\langle b^0, u^0 \rangle, e^0 \circ f \rangle \\ \xrightarrow{e'} E\langle\langle b', u' \rangle, f' \rangle \end{array} \quad \begin{array}{l} \downarrow Et \\ E\langle\langle b', u' \rangle, f' \rangle \end{array}$$

The next theorem is an obvious consequence of 2.1.

2.2. Theorem. Let  $\underline{A}(\mathcal{F})$  have free algebras (i.e.  $\dashv U$ ) and coequalizers of all pairs. Then

(i) for each g.p.a.  $\mathcal{F}a \xleftarrow{P} x \xrightarrow{Q} a$  the full subcategory  $(\mathcal{A} \downarrow U)^{\langle P, Q \rangle}$  is reflective in  $(\mathcal{A} \downarrow U)$ ;

(ii) each g.p.a.  $\mathcal{F}a \xleftarrow{P} x \xrightarrow{Q} a$  has a free completion in  $\underline{A}(\mathcal{F})$ .

2.3. Remark. The (ii) part of the above theorem improves a result of Koubek and Reiterman ([5] p. 220). Indeed, if  $\underline{A}$  is cocomplete, E-co-well-powered and  $\mathcal{F}: \underline{A} \rightarrow \underline{A}$  preserves E of an image factorization system  $(E, M)$ , then  $\underline{A}(\mathcal{F})$  has coequalizers of all pairs (see [1 - 3]).

2.4. Remark. The reflection of an  $(\mathcal{A} \downarrow U)$ -object  $a \xrightarrow{f} b \xleftarrow{u} \mathcal{F}b$  in  $(\mathcal{A} \downarrow U)^{\langle P, Q \rangle}$  also can be obtained by using a certain free completion. Take the g.p.a.  $\mathcal{F}b \xleftarrow{\tilde{P}} x \amalg \mathcal{F}b \xrightarrow{\tilde{Q}} b$  where  $x \amalg \mathcal{F}b$  denotes an  $\underline{A}$ -coproduct with injections  $j_x, j_{\mathcal{F}b}$  and  $\tilde{P} \circ j_x = (\mathcal{F}f) \circ p, \tilde{P} \circ j_{\mathcal{F}b} = 1_{\mathcal{F}b}$  defines  $\tilde{P}$  and  $\tilde{Q} \circ j_x = f \circ q, \tilde{Q} \circ j_{\mathcal{F}b} = u$  defines  $\tilde{Q}$ . The free completion (2./6) of this g.p.a. yields the required reflection:  $k: \langle\langle b, u \rangle, f \rangle \longrightarrow \langle\langle b^0, u^0 \rangle, k \circ f \rangle$ .

(2./6)

$$\begin{array}{ccc} Fb & \xleftarrow{\tilde{p}} & x \parallel Fb \xrightarrow{\tilde{q}} b \\ \downarrow Fk & & \downarrow k \\ Fb^0 & \xrightarrow{u^0} & b^0 \end{array}$$
